

# User Stories & Product Backlog

## A Case Study: Developing an AI-Enhanced Budgeting System

### Course & Theme Context

This presentation explores the practical application of Agile principles in the Software Project Management (SPM) course, focusing on the progression **From Roles → to Tasks → to Deliverables** within an IDEAL Labs project structure.

### Project Team

- Ahmad Sajjad (2023-CS-81)
- Ahmad Hassan (2023-CS-77)
- Huzaifa Arshad (2023-CS-86)
- Atif Awan (2023-CS-154)

# Defining the Scope: Project Epics

Our project scope for the AI-Enhanced Budgeting System was initially broken down into three major feature areas, or Epics. These were identified during the initial stages of Sprint 1 and 2 after defining the core system architecture.

Epic 1: Expense Management

Core functionality for capturing, tracking, and validating all incoming expenditure records within the lab environment.

o

o

o

Epic 2: Budget Planning & Tracking

Enables users to set financial targets, monitor real-time spending against those targets, and generate summary reports.

Epic 3: AI Prediction & Insights

Integration of machine learning models to forecast future spending patterns and deliver actionable, data-driven financial advice.

The diagram illustrates a central hub labeled "Epics User story types" connected to several surrounding boxes, each representing a specific user story type. The boxes are arranged in a circular pattern around the central hub. The boxes include:

- Accuser 12: Expense report history
- Accuser 13: Expense report history
- Accuser 14: Expense report history
- Accuser 15: Expense report history
- Accuser 16: Expense report history
- Accuser 17: Expense report history
- Accuser 18: Expense report history
- Accuser 19: Expense report history
- Accuser 20: Expense report history
- Accuser 21: Expense report history
- Accuser 22: Expense report history
- Accuser 23: Expense report history
- Accuser 24: Expense report history
- Accuser 25: Expense report history
- Accuser 26: Expense report history
- Accuser 27: Expense report history
- Accuser 28: Expense report history
- Accuser 29: Expense report history
- Accuser 30: Expense report history
- Accuser 31: Expense report history
- Accuser 32: Expense report history
- Accuser 33: Expense report history
- Accuser 34: Expense report history
- Accuser 35: Expense report history
- Accuser 36: Expense report history
- Accuser 37: Expense report history
- Accuser 38: Expense report history
- Accuser 39: Expense report history
- Accuser 40: Expense report history

Made with GAMMA

# Translating Needs: Core User Stories

User Stories ensure development remains centered on end-user value. Each story describes a desirable outcome for a specific user role.

## User Story 1: Expense Categorization

*As a **lab manager**, I want to record and categorize all lab expenses so that I can monitor spending effectively.*

## User Story 2: Budget Visibility

*As a **researcher**, I want to view visual reports of lab budgets so that I can understand where funds are being used.*

## User Story 3: Predictive Allocation

*As an **admin**, I want the AI model to predict future expenses so that I can allocate budgets more accurately.*

# Product Backlog: Tasks for Execution

The Product Backlog breaks down each user story into concrete, executable tasks, aligning requirements with the work needed for upcoming Sprints (3 and 4).

Story #	Backlog Items (Tasks)	Priority
1	Design database for expense records; Implement CRUD API for expense tracking; Add data validation for entries	High
2	Create dashboard UI; Integrate backend data visualization; Test report generation module	Medium
3	Integrate AI model for predictions; Optimize data flow; Validate model output accuracy	High

# Prioritization, Reflection, and Next Steps

## Backlog Prioritization: MoSCoW Method

We used the MoSCoW method to define clear release goals, ensuring critical features are delivered first:

### → Must Have (Critical)

Expense APIs, Dashboard display, AI Prediction core function.

### → Should Have (Important)

Report Export functionality, Comprehensive User Roles Management.

### → Could Have (Desired)

Proactive Budget Alerts and Notifications system.

## Key Reflections on Agile Practice

- 📄 By focusing on User Stories, the team successfully avoided technical debt early on and remained focused on **real-world user value** rather than implementation details.

The structured Product Backlog serves as a crucial artifact, providing a clear roadmap that directly links user requirements to engineering tasks and projected deliverables. This improved team coordination and clarity for Sprint 3 and 4 execution.
